

What is claimed is:

1. A system for testing a plurality of test structures, said system comprising a logic circuit which is configured to receive a triggering signal, said logic circuit connectable to a plurality of rows of test structures, said logic circuit  
5 configured to selectively turn on the rows of test structures depending on the triggering signal which is received.

2. A system as recited in claim 1, wherein the logic circuit is connectable to 256 rows of test structures.

10 3. A system as recited in claim 1, wherein the system is configured to measure transistors, wherein the test structures comprise transistors.

4. A system as recited in claim 1, wherein the logic circuit is  
15 connectable to 256 rows of transistors.

5. A system as recited in claim 1, wherein the logic circuit comprises a incrementor which is configured to receive the triggering signal.

20 6. A system as recited in claim 5, wherein the logic circuit further comprises a decoder which is connected to the incrementor.

7. A system as recited in claim 6, wherein the decoder is connectable to the rows of test structures.

8. A system as recited in claim 5, wherein the logic circuit comprises a incrementor and a decoder, said incrementor being configured to receive the triggering signal and having eight output lines, said eight output lines being connected to eight address inputs of said decoder, said decoder having 256 output lines, said 256 output lines being connectable to 256 rows of test structures.

9. A method for testing a plurality of test structures, said method comprising: connecting a plurality of rows of test structures to a logic circuit, providing a triggering signal to the logic circuit, wherein the logic circuit selectively turns on the rows of test structures depending on the triggering signal which is received.

10. A method as recited in claim 9, further comprising connecting the logic circuit to 256 rows of test structures.

11. A method as recited in claim 9, wherein the step of connecting a plurality of rows of test structures to a logic circuit comprises connecting a plurality of transistors to the logic circuit.

12. A method as recited in claim 9, wherein the step of connecting a plurality of rows of test structures to a logic circuit comprises connecting 256 rows of transistors to the logic circuit.

5 13. A method as recited in claim 9, wherein the step of providing a triggering signal to the logic circuit comprises providing the triggering signal to an incrementor.

10 14. A method as recited in claim 13, wherein a decoder is connected to the incrementor and said step of connecting a plurality of rows of test structures to the logic circuit comprises connecting the test structures to the decoder.

15 15. A system as recited in claim 13, wherein the incrementor has eight output lines, said eight output lines are connected to eight address inputs of said decoder, said decoder has 256 output lines, and said 256 output lines are connectable to 256 rows of test structures.
